COMPANION NOTE · PREPARED FOR DATA & INSIGHTS · SENIOR DATA ENGINEER

Different market, **same job.**

Why Lifepal's insurance marketplace, consumer and B2B, maps onto Codat's business-data platform.

Both businesses sit in the middle. Lifepal connected people and SMBs with the insurers that cover them; Codat connects SMBs' accounting, ERP, banking and commerce data with the lenders, banks and platforms that serve them. In both, many partners describe the same thing differently, data changes after the fact, each party may only see what it was shown, and a real financial decision depends on the number being right. The data problems that follow are the ones NEXUS was built to solve.

Accounting · ERP | Banking | Commerce | Insights | MCP

BUILT IN lifepal → PRESENTED TO Codat

ONE FLOW, TWO BUSINESSES

Codat side from public material

01 Source	02 Connect	03 Record	04 Change	05 Decide
Lifepal · insurer systems, partner files	**Lifepal** · a customer or SMB applies once	**Lifepal** · application, quote, policy	**Lifepal** · CDC and late insurer statuses	**Lifepal** · insurer quotes and binds
Codat · accounting, ERP, bank, commerce	**Codat** · an SMB connects its systems once	**Codat** · invoice, payment, bank line, payout	**Codat** · re-syncs, edits, backdated entries	**Codat** · lender or platform decides

THE CLOSEST PARALLEL: LIFEPAL B2B

SMBs connected to insurers

LIFEPAL B2B · SMB → INSURER

SMB	Shares once	Many insurers	Decision
A small business needs cover for itself and its team.	Company and team data, with consent, in one place.	Each needs it in its own format to quote.	Quote, bind, renew. Late status updates arrive for days.

CODAT · SMB → LENDER OR PLATFORM

SMB	Connects once	Standard model	Decision
A small business applies for credit or a service.	Its accounting or ERP, bank and commerce accounts.	Many systems mapped to one data model.	Underwrite, monitor, reconcile. Books keep changing.

THE SAME PROBLEM	HOW I HANDLED IT AT LIFEPAL	WHERE IT SHOWS HERE
Collect once, serve many	One application, mapped to each insurer's format by contract, not by hand.	Source contracts map each platform onto one canonical invoice.
Consent per party	Each insurer saw only the SMBs that applied to it: a row policy.	Consent row filter; a revoked connection disappears everywhere.
Late, changing statuses	Newest status wins; 72-hour lookback, the p99.5 of insurer delay.	Ordered MERGE; backdated credit notes restate, v0 stays queryable.
One number for both sides	"Bind" agreed once with insurers and finance; requests −60%.	Semantic layer and MCP: one revenue, one cash flow.

Described at the level I can share publicly; I'm happy to walk through the details in conversation.

WHAT CODAT CONNECTS

as listed on codat.io · data here is synthetic

ACCOUNTING AND ERP

Xero · QuickBooks Online · Sage · NetSuite · Dynamics 365 Business Central · FreeAgent

Here: two fictional accounting platforms and a fictional mid-market ERP, each with its own invoice schema.

BANKING

Open banking feeds · Plaid · TrueLayer

Here: one bank feed per company, reconciled to the reported balance.

COMMERCE

Shopify · Stripe · Square · Amazon Seller

Here: a fictional payouts feed, matched to the bank within three days.

SCALE

350,000+

live connections to business customers' finance systems, as Codat's site states.

CONCEPT MAP

same grain, different names

LIFEPAL · INSURANCE MARKETPLACE	CODAT · BUSINESS DATA (MY READING)	GRAIN	SHARED DATA PROBLEM
Insurer partner consumer insurers · SMB insurers	**Connected system** accounting · ERP · bank · commerce	one row per source record	Conform many schemas to one model before anyone reads it
Insurer sees its own applicants row access policy	**Customer sees consented companies** customer × company	one row per (customer, company)	Isolation by policy, not by copying data
Application → decision declined · approved, 2nd try	**Invoice → payment** open · paid · voided later	one row per document version	Newest version wins; replays never double count
Bind rate bound ÷ applications	**Revenue, cash flow, DSO** one definition each	company × month	One definition that reconciles to source
Plan version price changes mid-year	**Chart of accounts** account remapped	account × version (SCD2)	Join the version in force at the time
Late insurer feeds status up to 72h late	**Backdated entries** credit notes after close	one row per event	Restated, with time travel showing what was issued
Partner reporting insurer performance pack	**Insights** lenders · platforms	one product per audience	Many audiences, one number
RAG copilot, MCP agents 1,000+ outcomes a day	**AI systems over business data** semantic layer + MCP	one certified metric	Agents query the same truth as people, with permissions

Lifepal examples are from my own work. Codat examples come from the role, public information, and the synthetic data in this project.

WHAT CARRIES OVER DIRECTLY

proven at Lifepal

One definition per metric

Lifepal: agreeing "bind" took four workshops; ad-hoc requests then fell 60%.

Here: revenue and cash flow agreed once, in a contract, before any API or dashboard.

Isolation by policy

Lifepal: a row access policy scoped every insurer to its own data.

Here: each customer sees only consented companies; agents inherit it.

Late data, measured

Lifepal: lookback set at 72 hours, the p99.5 of partner delay.

Here: lookback sized from real re-sync and backdating lag per source.

History, not overwrite

Lifepal: changing attributes kept as SCD2, joined at the time they applied.

Here: account remaps can't rewrite last month's revenue.

Tests before trust

Lifepal: 500+ checks in production; data-trust escalations −60%.

Here: every contract compiles into checks; the bank break stays red.

WHAT IS DIFFERENT, AND HOW I WOULD ADAPT

DIFFERENCE	LIFEPAL	CODAT	HOW I WOULD ADAPT
Sources	Tens of insurers, a few internal systems	Many accounting, ERP, bank and commerce integrations	Learn Codat's standard data model first and build Insights on it; source contracts per integration
Scale	A mid-size marketplace	350,000+ live connections, as Codat states	Same contracts and tests; incremental builds and clustering by company from day one
Tenancy	Insurers and internal teams	Many customers, each with consented companies	Consent as data, one row filter, a tenant check on every product and every agent tool
Orchestration	Airflow in production	Dagster, Airflow or Temporal	Same principles: assets from contracts, retries, idempotency; follow the team's conventions
Who reads it	Internal teams and insurer partners	External customers through products, APIs and agents	Versioned metrics, owner approval on breaking changes, published freshness

Stated plainly. Lifepal outcomes come from my own record of the work. The Codat side is built from outside, from the role and public information; integration names are as listed on codat.io, and every company, customer and platform in the demo is fictional. No Codat systems or data were used.
Open questions for week one: which Insights metrics customers rely on most, who owns each definition, and how a restatement is explained to a customer today.
